Case Study

Cyber Framework Assessments

The Cyber Assessment Framework provides a methodical and comprehensive approach to gaging the extent to which cyber risks are managed and conducted.

CSA was approached by a council-led company providing bridge and ferry services in the South-West of England, to conduct a full cyber framework assessment against all of its IT and operations infrastructures. The company also required an independent study into its cyber security development so that it could justify future spends to fill any identified gaps. The company chose to be benchmarked against the Cyber Essentials framework and the NCSC Cyber Assessment Framework, as their objective was to demonstrate that it was compliant with these UK standards.

CSA deployed two of their Cyber Consultants to the site to conduct the framework assessment. The consultants used an interactive and constructive approach to produce their insightful recommendations and observations.

CSA drew up their conclusions and laid out in a report using a clear and simple template, illustrating the core findings and recommendations. CSA also included a proposed roadmap for the future of the company inclusive of a full technical report for use by the IT team. The framework assessment report allowed the Executive Team to authorise the spend required to fill the gaps and therefore improve the overall cyber security across the organisation.
