## Case Study

# Transport Industry

**Transport networks have become increasingly digitalised, with a wide range of data flowing across systems on a regular basis. As more devices and control systems are connected online, the risk factors to the storage and management of this sensitive information are increased.**

CSA provides its protective monitoring services suitable for this fast-moving industry whereby the protection of endpoints and servers is vital. The Boarderpoint system and the CSA SOC are deployed within two transport companies, providing around the clock coverage of IT infrastructures. CSA works with the transport company's IT Teams to alert on confirmed cyber incidents and advise on remediation activities.

A quick reaction is needed when an incident is confirmed and so CSA's 'always on' service and quick response times provide the much-needed 24/7 coverage that Operational Systems require. CSA also advised on areas where the company could improve its cyber security practices further with recommendations included in the reports that were generated. This could be user-awareness training or an annual cyber assessment.
