Case Study

SOC as a Service

For the majority of companies, the lack of sufficient cyber-security is a result of small budgets. Often minimum numbers of endpoints monitored can be cost-prohibitive, so a more scalable and affordable solution is required.

Whilst the company has the cyber infrastructure to enable monitoring and the detection of information security events and incidents, it lacked the people and experience to set up a SOC. The CSA Security Operations Centre (SOC) provided an outstanding vehicle for the company to outsource its cyber monitoring to a team of cyber professionals who could quickly react and report any suspicious cyber activity.

Working unanimously, both the CSA SOC and the Company's Cyber Team identify and more importantly, respond to potential threats. By contracting the SOC as a Service it allows the company to divert its limited cyber resources to longer-term investigations and response activities rather than undertaking monitoring and detection activities.

This service provides low-risk cyber support and allows the customer to retain both ownership and governance of its cyber infrastructure. An attractive aspect of this service is the on boarding and off-boarding times are minimal and all customer data resides on their own infrastructure.
